

Mainboard (Microcontroller) Design

2010-02-01 20:02:34 by Nick

I've completed a preliminary schematic and parts list for the mainboard (microcontroller board) for the Digital Thermostat Module. The mainboard components are a mixed combination of 5 Volt and 3.3 Volt components. The biggest issue at this point in the design is having enough I/O pins available on the ATmega324P. One change I have planned to make is reduce the number of pushbutton switches from 6 to 5 to free up an extra I/O pin. I believe that the reduction in the number of switches to 5 will not negatively impact the usability of the design. The preliminary schematic is shown below.

NOTES:

- The oscillator components (Q6, C1, C2) may be removed in a future revision if the microcontroller code runs fast enough with a slower clock and doesn't need the extra speed.
- Q1 and Q7 will be used to provide dimming of the LCD backlight and LED indicator lights on the thermostat (to reduce power consumption and allow for user adjustment)
- The relays for the thermostat functions must be able to handle at least 24VAC and 1 Amp at their contacts to be useful for controlling standard residential HVAC systems.
- All the relays are switched by the microcontroller using FETs, since the relay coils require more current than the microcontroller ports can sink/source.
- The switches are not debounced in hardware, but will instead be debounced using a combination of software and hardware timers in the microcontroller.

Parts List														
Part ID	Type	Attr.	Temperature			Digikey Part	Manufacturer Part	Unit Price			Extended Price			
			Min.	Max	Package			x1	x25	x100	Qty	x1	x25	x100
